

Boom Lifts

Boom Lifts Training Saskatoon - Boom Lifts are a platform lift device that can be lifted or lowered to differing heights, making this equipment a useful instrument for various industrial applications. There are many different varieties of Boom Lift consisting of knuckle booms, scissor platform lifts, and aerial platform lifts, each functioning differently.

The familiar aerial lift deviation is frequently utilized at ski lodges to transport people who are not comfortable using the snowboard lift. Working in a manner analogous to that of an elevator, snowboarders are transported up the mountain in stages, stopping at stations along the way until they arrive at the top. Aerial lifts are also used in construction, moving workers safely up and down the sides of multi-level building sites.

Scissor hoists are also in the boom jack group. They are used frequently by service providers as an idyllic way to permit workers to finish maintenance and repair on wires and cables that are attached to poles. Telephone, cable and power providers have relied on the effectiveness of this kind of boom lift for years.

The knuckle boom jack is created for use within locations of irregular terrain and where the need to change course may be required. This style of boom lift has the capability to fit in tight spots where a scissor jack cannot fit. Working between multiple equipment in a manufacturing plant or in near proximity sandwiched between two walls, the knuckle boom additionally features a standard platform fitted with rails for protection and worker safety.

The type of boom jack needed by companies will usually depend on the nature of the job needed. Fortunately, there are suitable types for practically any duty.
